

Acalabrutinib

This information is about a targeted medicine called acalabrutinib. It is used to treat some people with chronic lymphocytic leukaemia (CLL). We cover what it is, who might have it and how to take it. We also cover its main side effects and any special precautions you need to take while you're on it.

This information is aimed at people in the UK. We do our best to make sure it is accurate and up to date, but it should not replace advice or guidance from your health professional.

Summary

- Acalabrutinib is a targeted medicine used to treat chronic lymphocytic leukaemia (CLL).
- It comes as tablets that you take every day. The number of tablets you need to take should be printed on the named label on your medicine packaging.
- You will have blood tests to check how well your CLL is responding to acalabrutinib.
- Your haematology team will monitor how your body is coping with treatment.
- Side effects of acalabrutinib are usually mild to moderate. Some people have mild side effects, whereas others get more severe side effects.
- Some side effects can be serious if they are not treated promptly. Contact your haematology team straight away or go to A&E if:
 - You have bleeding such as blood in your poo or pee, nosebleeds, bleeding gums, vomiting or coughing up blood, heavy periods or bruising.
 - You think you might have an infection.
 - You have difficulty breathing, shortness of breath or your breathing is very fast.
 - Your heart rate is fast or uneven, or your pulse is weak or uneven.
 - You have diarrhoea, are feeling sick or are being sick.
 - You have muscle cramps or twitches or have a seizure (fit).
 - You feel very weak or exhausted or are fainting.
- Tell your haematology team if you get any other side effects. They may be able to suggest things to help.

This leaflet includes addresses and QR codes that link to webpages for further support. If you cannot access the webpages, please email information@leukaemiacare.org.uk or call **08088 010 444**.

What is acalabrutinib?

Acalabrutinib is a targeted medicine that blocks a protein called BTK. This protein helps CLL cells to grow and multiply. Blocking it stops CLL cells from growing and dividing, leading to their death.

The brand name for acalabrutinib is Calquence.

Who might take acalabrutinib?

Acalabrutinib is suitable for adults. Your haematology team might recommend it for you if:

- You have CLL and have not had treatment before **and**:
 - You have a genetic change in your CLL cells called a 17p deletion or TP53 mutation **or**
 - Other treatments are not suitable for you
- You have had treatment before, but your CLL didn't respond to it or came back after treatment. This is called refractory or relapsed CLL.

Before taking acalabrutinib

Before starting acalabrutinib, your haematology team will carry out checks to ensure it is suitable for you. These include:

- Blood tests to check your blood cell counts, kidney function and liver function
- Blood tests to check whether you have any infections that could flare up during treatment, like viral hepatitis
- Checks of your heart health

Your team may recommend other tests, depending on your circumstances.

Your haematology team may ask if there is any possibility you might be pregnant. Acalabrutinib should not be taken during pregnancy.

Some medicines, supplements and food may interact with acalabrutinib. Or they may increase your risk of side effects. It is important to tell your haematology team about any medicines or supplements you are taking. This includes prescribed medicines and medicines you have bought yourself without a prescription. Examples include:

- Herbal medicines such as St John's Wort
- Some blood thinners or medicines used to prevent blood clots, like warfarin
- Some medicines used to treat infections, including some antibiotics, antifungal and antiviral medicines
- Some medicines used to treat schizophrenia and other psychoses
- Some medicines that lower your immune system
- Some medicines used to treat diabetes
- Some medicines used to treat epilepsy
- Theophylline, a medicine sometimes used to treat asthma, chronic lung disease or heart failure

Acalabrutinib tablets contain several ingredients. Tell your haematology team if you have any allergies or sensitivities.

How do you take acalabrutinib?

Acalabrutinib comes as orange, oval-shaped tablets that you take by mouth.

- Swallow your acalabrutinib tablet whole with a glass of water.
- Do not break, crush, or chew your tablets and do not dissolve them in water.
- Try to take your tablet at about the same time each day.
- You can take your tablet with or without food.
- Do not take supplements containing St John's Wort while taking acalabrutinib. This is because it affects how much acalabrutinib your body absorbs.
- If you also take a medicine called methotrexate, you should take this at least 6 hours before or after taking acalabrutinib.

If you forget to take your tablets

If you forget to take acalabrutinib:

- Take it as soon as you remember, if it's **within 3 hours** of your dose time
- If it's **longer than 3 hours** by the time you realise you forgot to take it:
 - Skip the missed tablet
 - Take your next tablet at the usual time

It is important not to take a double dose. If you've taken more acalabrutinib than you should, talk to your doctor, nurse or pharmacist. Or go to the hospital immediately. Take your medicine and the leaflet from its box with you.

Dose

Acalabrutinib comes as tablets containing 100mg of acalabrutinib. The number of tablets you need to take and how often should be printed on the medicine packaging. If you are not sure, ask your doctor or nurse.

Most adults with CLL take one tablet of acalabrutinib twice a day. You usually leave around 12 hours between each dose. Try and take it at the same time in the morning and in the evening.

Acalabrutinib comes in a blister pack with pictures on each blister to help you take your dose at the right time. There's a sun for your morning dose and a moon for your evening dose.

Where do you take acalabrutinib?

You take acalabrutinib at home (or anywhere you are staying). You do not have to go to hospital to take it.

You can store acalabrutinib at room temperature. Keep it safe where children cannot see or reach it.

How long do you take it for?

Do not stop taking acalabrutinib without discussing it with your haematology team.

Most people carry on taking acalabrutinib for as long as it is working. Your haematology team may suggest stopping acalabrutinib and trying a different treatment if:

- It is not working well
- It stops working
- You are having side effects that are difficult to cope with
- Check-ups show it is affecting other parts of your body, like your heart, lungs or liver
- You become pregnant

How you'll be monitored

Your haematology team will check how well acalabrutinib is working and how well your body is coping with it.

- You'll have blood tests to check your blood cell counts.
- You'll also have occasional blood tests to check how well your liver is working.
- You'll have regular blood pressure checks.
- Your doctor or nurse will examine you to check for heart or lung problems, signs of infection, and changes in your skin.
- You may have other examinations and scans to check the size of your lymph nodes and organs, like your spleen.

Precautions to know about

There are some precautions to be aware of when you are taking acalabrutinib.

- If you need surgery or to have a tooth out, you'll need to stop acalabrutinib for a few days before and after. This is to reduce your risk of bleeding. Your doctor will tell you exactly when to stop taking acalabrutinib and when to start it again.
- Acalabrutinib can make you vulnerable to serious infections. You might need to take medicines to prevent infections while taking acalabrutinib.
- Acalabrutinib might make you feel very tired or dizzy. You should not drive or operate machinery if you have these symptoms.
- If you've had viral hepatitis in the past, it might flare up during acalabrutinib treatment. You'll have a blood test before you start treatment. If this shows you've had viral hepatitis, your team will monitor you for flare-ups. You might be referred to a liver specialist for treatment.

"If your GP prescribes you a new medicine, ask them to check that it's safe to take with acalabrutinib."

Helen, living with CLL since 2015

Fertility, pregnancy and breastfeeding info

We do not know what effect acalabrutinib has on fertility or pregnancy. Based on animal studies, it may harm unborn babies, especially during the later stages of pregnancy and during labour and birth.

- If you could get pregnant, it's important to use effective contraception while you are taking acalabrutinib.
- If you're taking acalabrutinib and you think you might be pregnant, tell your haematology team as soon as possible.
- If you're planning to get pregnant in the future, tell your haematology team. They will talk to you about your treatment options.

Breastfeeding

We do not know if acalabrutinib passes into breastmilk or what effect it might have on breastfed babies or children.

You should not breastfeed while you are taking acalabrutinib and for 2 days after taking your last dose.

Possible side effects

You may get some side effects while you are taking acalabrutinib. Some people have very few side effects, whereas others get more serious side effects. They may differ from day to day.

Your haematology team should tell you what side effects to look out for and who to contact if you need to.

If you are worried about any symptoms or side effects, contact your haematology team. You do not have to wait until your next appointment.

Your haematology team might:

- Prescribe medicines to help manage some side effects
- Suggest things you can do to help you cope with side effects
- Lower your dose of acalabrutinib if your side effects are serious or difficult to cope with
- Recommend pausing or stopping acalabrutinib, if needed

You can also report side effects via the [Yellow Card Scheme](#). Follow the link, scan the QR code or search for 'yellow card' at www.gov.uk. Or search for MHRA Yellow Card in the app store you usually use.

Side effects you might notice

Here, we list some of the more common side effects of acalabrutinib. These affect at least 1 in every 100 people who take acalabrutinib.

- **Infections.** Contact your team straight away if you think you have an infection. Look out for:
 - A high temperature (38°C or higher)
 - Shivering, chills or sweating
 - Sore throat, sneezing, blocked or runny nose or earache
 - Cough, chest pain or shortness of breath
 - Burning or stinging when you pee, or peeing more often than usual
 - Sickness or diarrhoea
 - Cold sores, or ulcers or blisters around your mouth or genitals
- **Unexpected or unusual bruising or bleeding,** like nosebleeds, bleeding gums or heavy periods. Look out for blood in your poo or pee, or red or purple spots under your skin. This may look different in black or brown skin. Tell your team if you notice any of these.
- **Tummy problems.** You might get diarrhoea, constipation, or tummy ache. You might feel sick or be sick. If you have these side effects, your team can give you medicines to help.
- **Muscle, bone or joint pain.** Talk to your team if this becomes troublesome.
- **Changes to your skin.** You might get a rash. This might look different on black or brown skin.
- **Headache.** This is common in the first weeks of taking acalabrutinib and usually gets better with time.
- **Fatigue.** You might experience extreme tiredness or lack of energy.
- **Heart problems.** Contact your doctor if you get a fast or irregular heartbeat or a heart flutter. They will check your heart function. If there are problems, they might suggest stopping acalabrutinib.

Protecting yourself from skin cancer

Acalabrutinib can increase your risk of getting some types of skin cancer.

It is important to protect your skin from the sun by keeping your skin covered, wearing a wide-brimmed hat, and using a high-factor sunscreen (SPF 30 or higher).

Check for symptoms like a growth, an unusual patch (this can vary in size, colour and texture), a new mole or a change in an existing mole. If you notice any of these, contact your GP.

Side effects your team might notice

There might be some side effects that your haematology team find during regular checks and blood tests. These include:

- Low levels of white blood cells (leukopenia), including low levels of white blood cells called neutrophils (neutropenia). This can make you more vulnerable to infections. You might need treatment to prevent or treat infections. Or growth factors to boost your production of white blood cells.
- Low levels of red blood cells (anaemia).
- Low levels of platelets (thrombocytopenia). This can cause unusual bruising and bleeding because platelets help your blood to clot. You might need to have a transfusion.
- High blood pressure. If this happens, you might need to take blood pressure medicines.

This is not a full list of all the side effects that can happen. The patient information leaflet in your medicine package has more information. Or you can find the leaflet in the [Electronic Medicines Compendium](#). Follow the link, scan the QR code or search for 'acalabrutinib' at www.medicines.org.uk/emc.

Rare side effects to know about

Rarely, acalabrutinib might cause a side effect called **tumour lysis syndrome**. This is a serious side effect of some cancer treatments. It happens if a large number of cancer cells die quickly and release chemicals into your bloodstream. This affects fewer than 1 in every 100 people taking acalabrutinib. So, it does **not** happen to more than 99 in every 100 people. However, if it does happen, it can be serious, so it's sensible to know what to look out for.

Symptoms of tumour lysis syndrome

Contact your doctor immediately if you develop any of the following while taking acalabrutinib:

- Fever or chills
- Diarrhoea, feeling sick or being sick
- Muscle or joint pain
- Cloudy or dark-coloured pee
- Feeling weak, exhausted or confused
- Irregular heartbeat or shortness of breath
- Pain or bloating in your tummy
- Seizures (fits)

"If you have to go to A&E, tell the staff you have blood cancer and the treatment you're on. Your team might give you a Patient Alert Card to keep with you. In a medical emergency, these cards let people know what medicine you're taking and help keep you safe."

Steve, living with CLL since 2011

What if acalabrutinib doesn't work?

If acalabrutinib is not working well for you, your doctor will discuss your options with you. They might suggest changing your dose, pausing or stopping treatment. They will talk to you about other treatment options that might be suitable for you.

Further information

We have more [information about CLL](#) including booklets and factsheets to download. Follow the link, scan the QR code or search 'CLL' at leukaemiacare.org.uk

We also have [booklets you can order in print free of charge](#). Follow the link or search 'CLL' at shop.leukaemiacare.org.uk or scan the QR code.

We'd like to thank the expert reviewers and patient contributors who helped us with this information:

- Professor George Follows, Consultant Haematologist, Cambridge University Hospitals NHS Foundation Trust
- Helen Knight, CLL Clinical Nurse Specialist, Nottingham University Hospitals
- Patient reviewers and contributors: Helen, Jane and Steve

Feedback on this leaflet? Follow the link or scan the QR code to complete a [short survey](#) to tell us what we can improve. Or get in touch by email, phone or post.

- Email information@leukaemiacare.org.uk
- Call us on **08088 010 444**
- Write to **Leukaemia Care, One Birch Court, Blackpole East, Worcester, WR3 8SG**
